CASE : Shibwe Kakamega

1. **Hospital core:**
   a. Only filter those services that have values attached to them. For non paying facilities, please adjust all the services to zero. To replicate this try by adding a patient service at the cashier with the service that the price is NOT set yet. Such a service should NOT be available for selection.
   b. Add the sick off object to be used in other modules(queuing and OPD) for requesting sick leave from the facility where the patient is being attended to.
2. **Financial/reporting module**
   a. All patient line listing reports now include the date parameters where a list can be pulled even for a day.
   b. MOH 204 A and B now pulls diagnosis, vitals for patients captured within the specified period, display of identifiers(with patient clinic number as prime) and proper date of visit accurate to the second. Also added Final and Provisional diagnosis.
   c. Removal of merged cells in the 204 A and B on the final diagnosis entry.
   d. Patient malaria report, remove duplicates of entries and provide date of when the encounters were filled.
   e. Remove spaces in the template display for the patient records on MOH 204 A and B.
   f. Matching 705 A and B workload to tally with 717 workload.

3. **Concept dictionary management**
   a. Optimize the service charter loading, initially it was loading forever, now takes seconds.
4. **OPD numbers:** This number is stored in the patient clinic number on the EHR, this number is optional and may end up being overlooked and left black. If this number is provided for the patient, its equivalent entry will appear on the MOH 204A and B as required, if not provided, nothing will display.
5. **OPD:**
   a. Added the provider name and the date of the encounter(when the patient was seen).
6. **Inventory module:**
   a. Upload of the items via a csv loaded in the module
   b. Receipt of items based on the categories needed
   c. Issue of items from within the inventory to patients

      d. Billing of the items at the cashier on the non pharm tech tab

7. **Radiology Module**
   a. Add a mechanism to save, enter the results and send the patient back to the doctor.
   b. Only load the queue with the tests that do not have status set, all accepted tests must exit the queue.
   c. Every test that will appear here must be set per the service charter and monetary value attached to it.
8. Now able to send the patient to the walk in queue immediately after the registration process is complete. No need to pass by the doctor.
9. Lab tests like Salmonella typhi rapid diagnostic tests are now able to be billed and sent to the lab for sample collection and examination.
10. Hemoglobin is now able to accept the decimals in the results.
11. Reports on Children and Adults laboratory tests results need a date of service row and Gender row
12. Displaying of more vitals on the MOH204 A and B, able to display all the final diagnosis for the patient within the period separated by a pipe(|).
13. Internal referral feature fixed, a patient can be referred within other departments within the facility
14. Removal of duplicates on patient searches at the walk in and OPD queues.
